

**SYNTEKO®**

**Tint your oil  
and show who you are...**

STEEL BLUE ON PINE

## **not just anybody.**

Wood is a living material with a great variety of different types of wood, all with own characteristics, all giving another look to your interior. But not only the type of wood is important. The way to protect it, is even more determinative for the final appearance. So you already might have experienced that floors treated with oil will have a deeper and more natural appearance than painted or even stained floors.

New and different is that now you can also treat floors with tinted oil. So, why not try Mahogany and decorate with white textiles to express the colonial empire of India? Or colour the floor with Ebenholz, combine it with velvet tapestry and renew the orange-brown corduroy sofa from the seventies?

All wooden surfaces can be treated with oil, with or without tinting. Do not longer wait to give your grandmother's side-board a look of the Provence by using the Olive colour. Or fresh up the wainscotting in your summer cottage with the romantic Rosewood colour. Everything is possible. If you change your mind, just sand back to bare wood and choose a new colour.

# Oiled floors last longer.

Oil penetrates deeply into the wood, this will not only give an optimum protection to all floors but it will also determine the intensity of the colour and accentuate the wood grain. Tinted oil has the same properties as neutral oil. Synteko Tinting Pastes are based on oil and are especially developed to be mixed with

Synteko Solid, the product par excellence for floor protection, even for floors with high traffic. For a contemporary decoration of wooden floors Synteko has introduced 7 modern tinting pastes. Synteko tinted oil increases the beauty of a wooden floor and makes it more vivid. According to the type of wood and its structure, the colour can vary. For more information you can also consult the technical data sheet on our site [www.synteko.com](http://www.synteko.com).
